CASE STUDY · TELECOMMUNICATIONS · COST DISCIPLINE & INTELLIGENT ROUTING

A telecom operator got one view of eleven agent frameworks and four providers

Nobody could say how many agents were running. The first week of cross-provider tracing found 41 in production that no one had registered.

Scenario	Published	Orcher components
Telecommunications operator · 22m subscribers	2026-08-05	Observability, Cost Governance, Immutable Audit Ledger

Summary

Six business units at a telecom operator had each adopted their own agent framework and provider. Orcher's Observability layer traced every execution across all of them — which model, which role, what cost, what outcome — and the inventory alone changed the operator's risk posture.

41
unregistered production agents discovered in week one

100%
of agent executions traced end to end
from an estimated 28%

4 → 1
provider dashboards required to answer a spend question

22%
of agent traffic found to be duplicated across business units

The situation

- Eleven agent frameworks and four model providers were in production across six business units.
- Each provider dashboard told a partial story, and none of them knew about human roles or business outcomes.
- The CIO could not answer a board question about how many autonomous systems were running against customer data.

What Orcher enforced

- Observability instrumented the execution path rather than the frameworks, so coverage did not depend on each team adopting a library.
- Every trace carries the directive, the role, the model, the cost and the committed outcome, joined into one timeline.
- Unregistered agents surfaced automatically as traffic with no registered owner, and were given owners or shut off.
- Cost Governance ceilings were applied afterwards, once the inventory was real.

The data

Business unit	Frameworks	Agents registered	Agents found	Action taken
Consumer care	3	14	27	Owners assigned
Network operations	2	9	12	Owners assigned
B2B service	2	4	11	6 retired as duplicates
Finance	1	2	6	4 retired
Field services	2	7	9	Owners assigned
Marketing	1	0	8	All 8 shut off

First-week discovery results from cross-provider tracing.

Outcomes

- The operator retired 18 agents as duplicates or orphans within a month.
- Board reporting on autonomous systems moved from estimate to inventory.
- Cost ceilings became enforceable, because the traffic they applied to was finally known.
- New agent deployments now register automatically as a side effect of running through the control plane.

> “We thought we had a governance problem. We had an inventory problem wearing a governance problem's clothes.”
>
> — Chief Information Officer, telecommunications operator (composite, modelled scenario)
